

Executive Summary

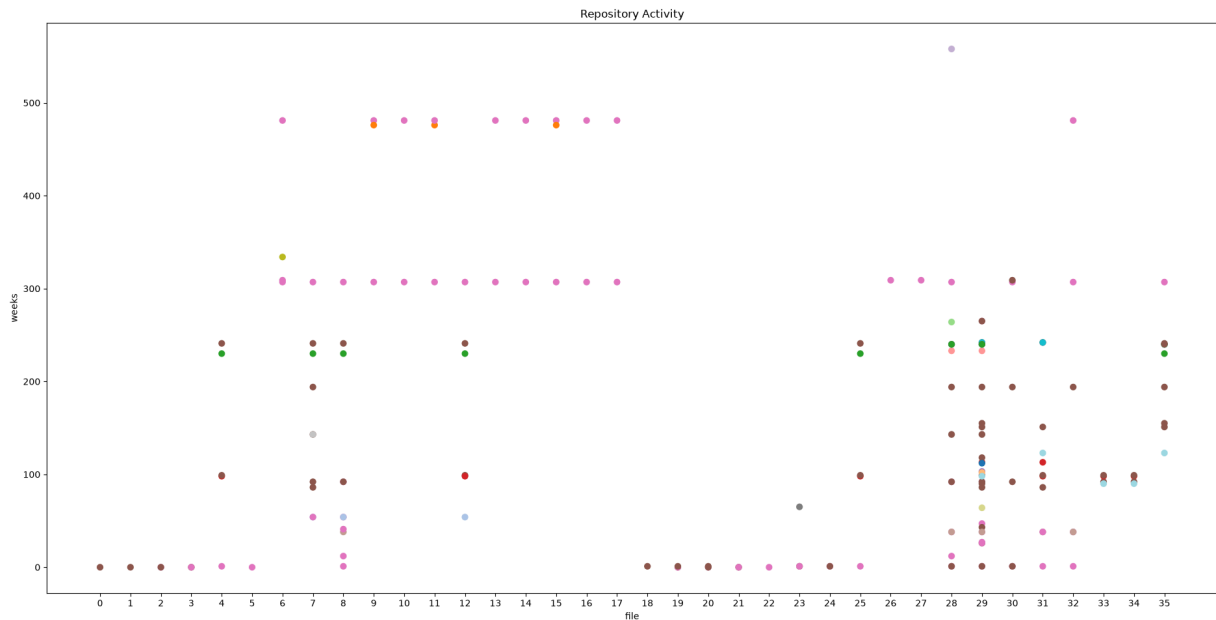

Overview

This report is to show the different source file activity amongst these files. This includes any source files using Java, Kotlin, C and C++ in the rootbeer repository. Every commit was ripped using the Github API to identify what files were changed how many times, by who, and at what date so that we can determine patterns that have surfaced in this project.

Important Findings

- RootBeer.java was changed 53 times total, which is the most updated file, with the second most touched file going to Const.java with 25 times total.
- In recent times, Scott Alexander-Bown has been the single contributor that has been maintaining the repository with his most recent contribution being in September 2024.
- At its peak, Scott Alexander-Bown as well as Matthew Rollings have been the ones to make the most amount of changes throughout the lifetime of the repository.

Scatterplot Visualization

In this visualization, Each point represents a contributor that has changed one source file during a given week throughout the repository's lifetime. The color represents the contributor, the x-axis represents the file that was being updated, and the y-axis represents the given weeks. Files 28-35 show that the repository was most interacted with in the first 300 weeks with different colored dots contributing over many different weeks. In recent times, the repository only has select files being changed and with large gaps of time between those changes as well.

Limitation

All commits were counted as an equal. This means that changes such as a single line typo versus an entire rewrite count equally regardless of their size. Because of this, it is not completely accurate as to what files were more actively maintained or worked on the most.
