

Repository Activity analysis: scottyab/rootbeer

Prepared by: Alex Cheda

Analysis Description:

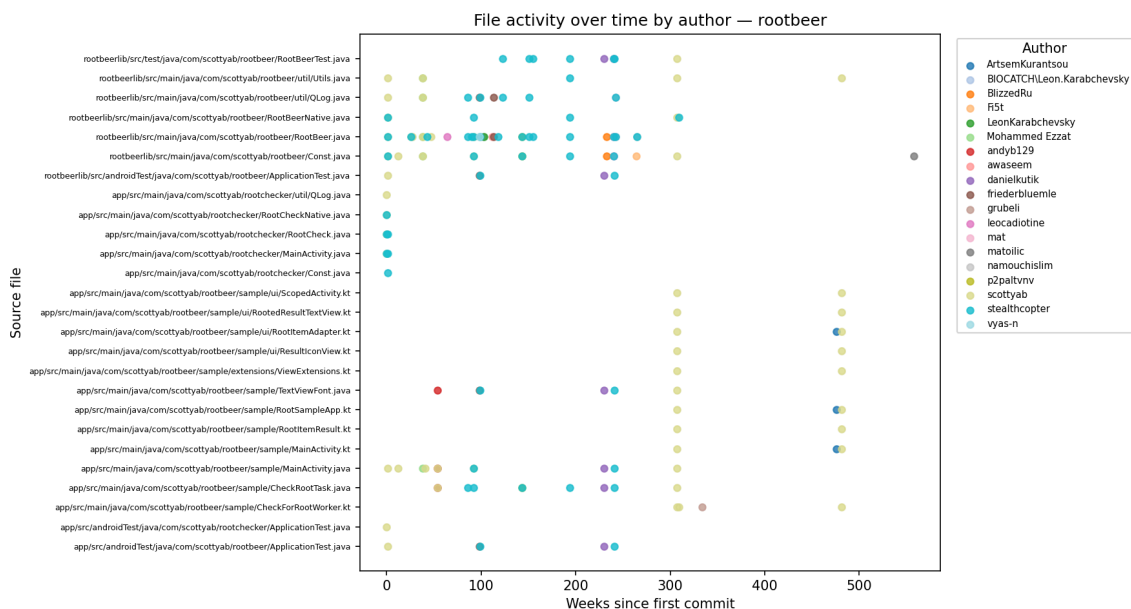

This report analyzes commit history for the scottyab/rootbeer android library, an open source root-detection tool using the Github API. The analysis captured 205 file-touch events across 26 source files and 19 distinct contributions.

Key Findings:

Development activity has been much more infrequent recently, only one has occurred in the last year. Most of the activity was before that meaning the library is currently in maintenance, Core logic is not dependent on a single contributor. The two largest contributors, scottyab and stealthcopter. They each had 75 and 73 touches. RootBeer.java also has 53 touches which is a close third.

A small number of files belong to a single writer. This writer is responsible for 8 files which are mostly components. They were made by scottylab since they aren't really core logic and more example files.

Visualization:

The scatterplot represents one contributor modifying one source per week since the original commit. Each color represents an individual contributor.

Limitations:

This analysis only covers .java and .kt files changes to build config, documentation etc. So total contributor effort may be undercounted if they touched these files.
