

scottyab/rootbeer Repo Executive Summary

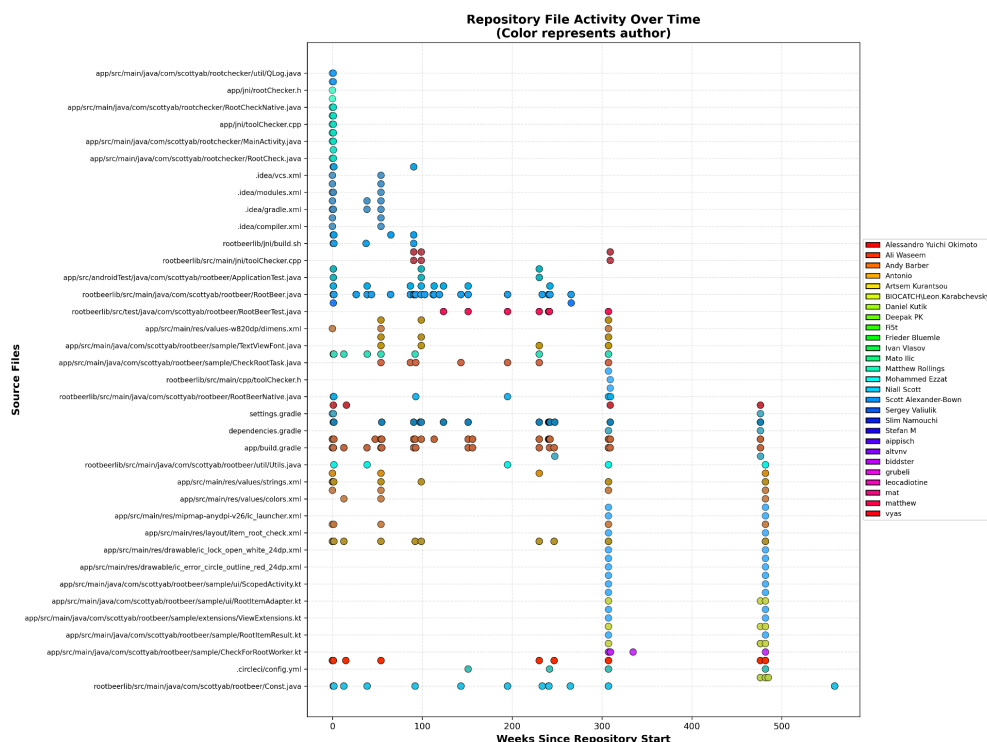

This executive summary is written for the express purpose of catching up all of leadership with the current status of the scottyab/rootbeer repository.

Development Activity and Contributors

Development has been going consistently for the past 500+ weeks with all major updates and commits being made as large patches and not multiple small ones. Our development team has changed over time but we still maintain some developers from the very beginning of this repo. Scott Alexander-Brown still remains our most active contributor with the most commits and has been contributing to this repository since the very beginning. Our most frequently changed files are the settings.gradle and dependencies.gradle for obvious reasons (configuration files).

Current Development Issues

We are still working on some persistent issues regarding the repository. The Const.java file is still solely maintained by Niall Scott with his also solely responsible for the rootchecker and QLog. We may want to look into getting new contributors for these roles to free Niall's current responsibilities for more pressing matters. We have also lost some of the contributors we worked with in the last major patch including but not limited to: Stefan M, altvnm, Antonio, ...

Here is the graph that all the previous assertions were based off of. This graph shows the author, file, and time of commit for the entire history of the repository. One limitation of the data we collected is the importance of the contributor in relation to their work. We know what authors touched what files and when but how can we quantify the value of that work? Working on rootkit for one commit could be seen as more valuable than multiple commits just changing the configuration files.
