

The analysis of the Rootbeer repository shows the amount of changes made to source files every week since the creation of the repository. Source files were selected by me, and merged commits were skipped to avoid duplicate commits. The contributor who performed the most work was Scott Alexander-Bown. He made the most changes by a significant amount. He is also the contributor who has been most active recently, with one change from Mato Ilic. Files 27, 28, and file 30 are the files with the most changes.

Scott Alexander-Bown is the most prominent contributor across all the files, which makes sense due to him being the repository owner. Most of the other contributors were most likely tasked with working on files 27-31, as the visualization shows a big cluster with different authors. Since so many different contributors were involved with these files, it shows that these files are very important.

The repository data also shows that there are big gaps in time between changes. The biggest gaps span one hundred-plus weeks. It shows how most of the development was made at the start of the project and later touched up on by the repository owner.

The visualization shows the number of changes to source files per week. Each dot represents a different author represented by a color. It helps provide a visual way of seeing the number of changes made to each file each week by different authors. One limitation of the analysis is that while it shows the number of commits, the scope and size of each commit aren't shown. Scott Alexander-Bown has the most commits, but the commits may not be that impactful.
