

Executive Summary

Analysis Overview

This report shows the commit activity for 14 production source files selected from the scottyab/rootbeer repository.

Key Findings

- The activity is concentrated in a small number of core files. Rootbeer.java and Const.java have over half of the changes listed. This shows that these two files are receiving the majority of the work and they likely play a pivotal part in the development.
- Scott Alexander-Bown and Matthew Rollings have over half of the contributions when looking at the pure number of changes. Matthews' work seems to have been more focused on the older files rather than the newer.
- Scott Alexander-Bown's work seems to be more focused on the more recent files as they began using kotlin, with many of the files only being changed by Scott alone.

Limitation

This analysis shows the amount of changes made by each person, but it does not show the significance or size of the modification. It could be something as simple as a comment added to a file and was changed. The analysis seems to value quantity over quality.
