

Executive Summary Of Rootbeer repository analysis

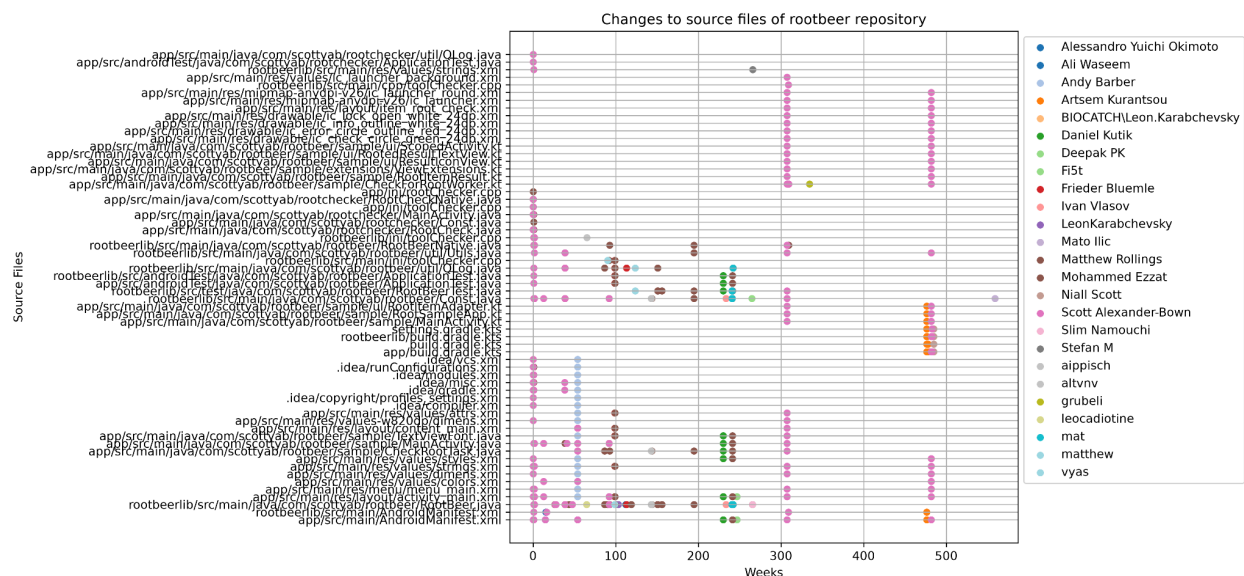

Introduction

This analysis was performed on the [scottyab/rootbeer](https://github.com/scottyab/rootbeer) repository using github api to scrape their commit history. The analysis focused on the repositories source files and how often the files were changed(through commits) and by who.

Significant findings

- The source file `rootbeerlib/src/main/java/com/scottyab/rootbeer/RootBeer.java` has by far changed the most of the repositories with 53 commits, more than double the next highest of 25.
- Scott Alexander-Bown has been the biggest contributor to source files in the repository since it was released
- Development of the repository has slowed significantly recently with there being only one commit to source files since 2024.

Scatterplot visualization

This visualization shows the changes made to source files. Each Dot is a commit colored to the author who made it. The dots height placement indicates which file the commit changed, and its horizontal placement indicated how many weeks after the very commit the commit was made

A downside of how this analysis was performed is that only total commit frequency was looked at. Not all commits have the same value to a repository but this analysis ignored how meaningful a commit was.
