Test Coverage Setup PR: <https://github.com/tylervu-unlv/Group-1/pull/37>

Test Coverage Setup Issue: <https://github.com/tylervu-unlv/Group-1/issues/36>

My Issue: <https://github.com/tylervu-unlv/Group-1/issues/57>

My PR: <https://github.com/tylervu-unlv/Group-1/pull/58>

Test and Behavior: Added a test to verify that `set_password()` stores a hashed value instead of plaintext and that `check_password()` accepts a proper password and rejects an incorrect password.

```

CI Workflow Evidence:

The screenshot shows a GitHub Actions workflow run for the job 'fix coverage artifact path'. The workflow is currently in the 'Summary' view, showing a successful run with a duration of 25s and 3 artifacts. The 'Summary' tab is selected, and the 'Annotations' tab is also visible. The 'Annotations' tab shows a list of annotations for the workflow, including 'build (3.0)', 'build (3.10)', and 'build (3.11)'. The 'Artifacts' tab shows a list of artifacts, including 'coverage-report-3.0', 'coverage-report-3.10', and 'coverage-report-3.11'.

Reflection: I was confused at first about what CI was when we discussed it in class, but after completing this assignment, it makes much more sense to me. Setting up CI allows us to

automate testing when submitting PRs through GitHub. This helps ensure that tests are consistently run without requiring every check to be performed manually on a local machine. As we have worked together on these labs, it has also become apparent how important communication is and how vital a role it plays in collaborative development. Oftentimes, a PR is submitted, but another PR is merged first, requiring the developer to update their branch with the latest changes from main and resolve any conflicts. This assignment seems like a small window into how collaborative software development works in practice.
